

Brainwaves to Email:

I will be using an EEG to create a system to be able to map out letters. For example, 'think arm move, think left leg move, then think right leg move' maps to the letter 'a'. Most of the work should be on the user experience and optimizing the efficiency of writing by letting most used letters have shorter codes.

Similar Projects

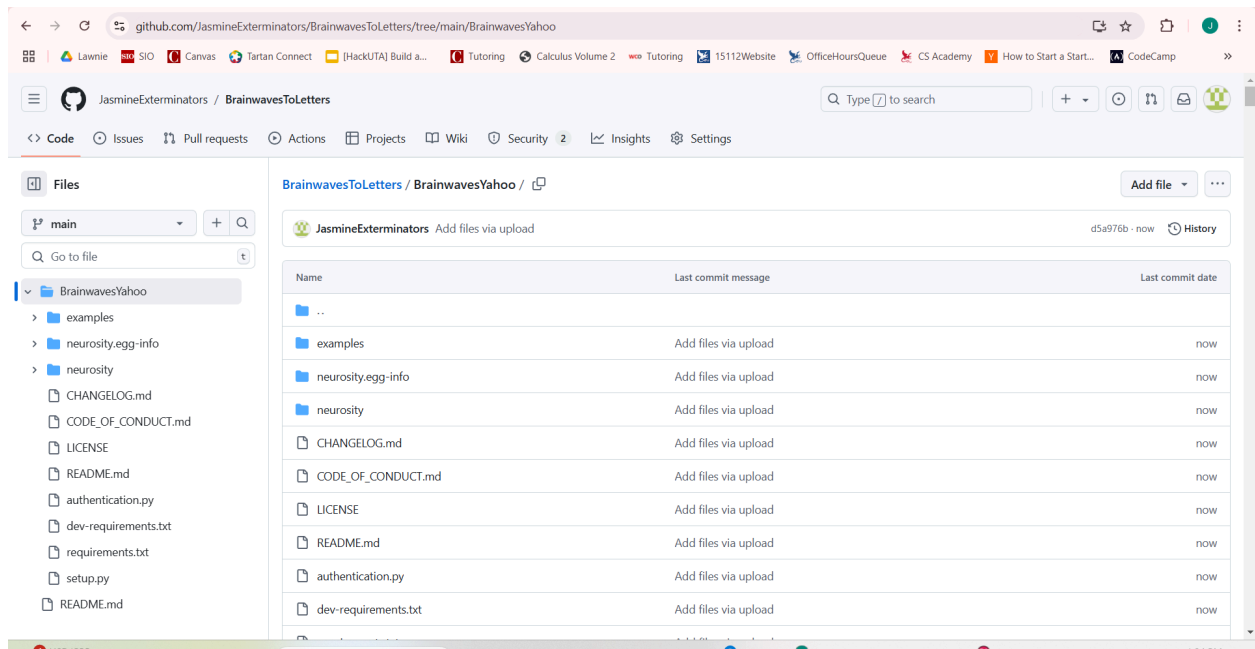

Here's a mapping numbers to letters questions that is sort of similar:

<https://stackoverflow.com/questions/6453859/mapping-numbers-to-letters>

There was also a previous TP project that made a car move with an EEG.

Version Control / Backup Plan

I'm using a Git Repository:
